

On the homotopy strand, outgoing arrows are set to 0.

by STU, first adding

STU can
always be
applied on the
homotopy strand

Like in the
non-virtual case,
all that remains is

Like in the non-virtual
case, the leaves of
these trees commute.

Finally, on these

trees, all arrows
point towards the root.

H^\rightarrow acts like
Ak-Tor's

Overall, A_n^\rightarrow acts on $L_{t,n}$ exactly like
tdv? Progress at last?

Question Verify that

$$U(tdv_n) \cong \overset{\rightarrow}{\text{A}}_{n+1} / \begin{array}{l} \text{homotopy on} \\ \text{the last strand.} \end{array}$$
