

Do Not Turn Over Until Instructed

Dror Bar-Natan: Talks: MAASeway-1810:

Thanks for inviting me to the fall 2018 MAA Seaway Section meeting!

Handout, video, links at $\omega\epsilon\beta$:=<http://drorbn.net/maa18/>

My Favourite First-Year Analysis Theorem

Abstract. Whatever it may be, it should say something useful and exciting and it should not be *about* rigour, yet it should *demand* rigour. You can't guess. You probably think it the dreariest. You are wrong.

Contents

Prologue

- 1 Basic Properties of Numbers 3
- 2 Numbers of Various Sorts 21

Foundations

- 3 Functions 39

Infinite Sequences and Infinite Series

- 20 Approximation by Polynomial Functions 405 ...

for every $\epsilon > 0$ there is $\delta > 0$ such that, for all x ,
if $0 < |x - a| < \delta$, then $|f(x) - f(a)| < \epsilon$.

If f and g are continuous at a , then

- (1) $f + g$ is continuous at a ,
- (2) $f \cdot g$ is continuous at a .

If f is continuous on $[a, b]$ and $f(a) < 0 < f(b)$, then there is some x in $[a, b]$ such that $f(x) = 0$.

7 Three Hard Theorems.

11 Significance of the Derivative.

$$y = x^2 - x$$

$$y' = 3x^2 - 1$$

$$= (\sqrt{3}x + 1)(\sqrt{3}x - 1)$$

$$= \begin{cases} > 0 & x > \sqrt{3} \\ < 0 & -\sqrt{3} < x < \sqrt{3} \\ > 0 & x < -\sqrt{3} \end{cases}$$

Several excerpts here are from Spivak's "Calculus" ©. I believe they fall under "fair use".

14 The Fundamental Theorem of Calculus.

If f is integrable on $[a, b]$ and $f = g'$ for some function g , then

$$\int_a^b f = g(b) - g(a).$$

*16 π is Irrational.

Dror Bar-Natan @drorbarnatan · 2 Apr 2013

$\pi = a/b$, $f(x) = x^n(a-bx)^n/n!$, n large $\Rightarrow 0 < V = \int_0, \pi f(x) \sin(x) dx < 1$. Repeated integration by parts & $f(x) = f(\pi - x) \Rightarrow V \in \mathbb{Z}$. So π is irrational.

20 Approximation by Polynomial Functions.

Suppose that f is a function for which

$$f'(a), \dots, f^{(n)}(a)$$

all exist. Let

$$a_k = \frac{f^{(k)}(a)}{k!}, \quad 0 \leq k \leq n,$$

and define

$$P_{n,a}(x) = a_0 + a_1(x-a) + \dots + a_n(x-a)^n.$$

Then

$$\lim_{x \rightarrow a} \frac{f(x) - P_{n,a}(x)}{(x-a)^n} = 0.$$

For example for $f(x) = \sin(x)$

at $a = 0$, $f^{(k)} = \sin, \cos, -\sin,$

$-\cos, \sin, \dots$, so

$$a_k = \begin{cases} \frac{(-1)^{(k-1)/2}}{k!} & k \text{ odd} \\ 0 & k \text{ even} \end{cases}$$

$$\text{In[1]:= } a_{k-1} = \begin{cases} (-1)^{(k-1)/2}/k! & \text{OddQ}[k] \\ 0 & \text{EvenQ}[k] \end{cases}$$
