### A Partial To Do List.

- Complete all “docility” arguments by identifying a “contained” docile substructure.
- Understand denominators and get rid of them.
- See if much can be gained by including  $P$  in the exponential:  $\mathbb{Q}^{L+Q}P \rightsquigarrow \mathbb{Q}^{L+Q+P}$ ?
- Clean the program and make it efficient.
- Run it for all small knots and links, at  $k = 2, 3$ .
- Understand the centre and figure out how to read the output.
- Execute the Drinfel’d double procedure at  $\mathbb{E}$ -level (and thus get rid of DeclareAlgebra and all that is around it!).
- Extend to  $sl_3$  and beyond.
- Do everything with Zip and Bind as the fundamentals, without ever referring back to (quantized) Lie algebras.
