

Shifted Partial Quadratics, their Pushforwards, and Signature Invariants for Tangles

<http://drorbn.net/ge23>

Abstract. Following a general discussion of the computation of zombians of unfinished columbaria (with examples), I will tell you about my recent joint work w/ Jessica Liu on what we feel is the “textbook” extension of knot signatures to tangles, which for unknown reasons, is not in any of the textbooks that we know.

Jessica Liu

Kashaev’s Conjecture [Ka]
Liu’s Theorem [Li].

$\sigma_{Kas} = 2\sigma_{TL}$. *big*

Columbaria in an East Sydney Cemetery

Jacobian, Hamiltonian, Zombian

A **Partial Quadratic (PQ)** on V is a quadratic Q defined only on a subspace $\mathcal{D}_Q \subset V$. We add PQs with $\mathcal{D}_{Q_1+Q_2} := \mathcal{D}_{Q_1} \cap \mathcal{D}_{Q_2}$. Given a linear $\psi: V \rightarrow W$ and a PQ Q on W , there is an obvious **pullback** ψ^*Q , a PQ on V .

Theorem 1. Given a linear $\phi: V \rightarrow W$ and a PQ Q on V , there is a unique **pushforward** PQ ϕ_*Q on W such that for every PQU on W , $\sigma_V(Q + \phi^*U) = \sigma_{\ker \phi}(Q|_{\ker \phi}) + \sigma_W(U + \phi_*Q)$. (If you must, $\mathcal{D}(\phi_*Q) = \phi(\text{ann}_Q(\mathcal{D}(Q) \cap \ker \phi))$ and $(\phi_*Q)(w) = Q(v)$, where v is s.t. $\phi(v) = w$ and $Q(v, \text{rad } Q|_{\ker \phi}) = 0$).

Prior Art on signatures for tangles / braids. Gambaudo and Ghys [GG], Cimasoni and Conway [CC], Conway [Co], Merz [Me]. All define signatures of tangles / braids by first closing them to links and then work hard to derive composition properties.

Gist of the Proof.

Why Tangles? • Faster!

- Conceptually clearer proofs of invariance (and of skein relations).
- Often fun and consequential:
 - The Jones Polynomial \rightsquigarrow The Temperley-Lieb Algebra.
 - Khovanov Homology \rightsquigarrow “Unfinished complexes”, complexes in a category.
 - The Kontsevich Integral \rightsquigarrow Associators.
 - HFK \rightsquigarrow OMG, type D , type A , $\mathcal{A}_\infty, \dots$

$2^{n/2} + 2^{n/2} + 2^{\sqrt{n}} \ll 2^n$

Computing Zombians of Unfinished Columbaria.

- Must be no slower than for finished ones.
- Future zombies must be able to complete the computation.
- Future zombies must not even know the size of the task that today’s zombies were facing.
- We must be able to extend to ZPUCs, Zombie Processed Unfinished Columbaria!

Columbarium near Assen

Example / Exercise. Compute the determinant of a $1,000 \times 1,000$ matrix in which 50 entries are not yet given.

Homework / Research Projects. • What with ZPUCs? • Use this to get an Alexander tangle invariant.

Reminders. {knots} \rightleftharpoons {matrices / quadratic forms} $\xrightarrow{\text{signature } \sigma} \mathbb{Z}$:

With $|\omega| = 1, t = 1 - \omega, r = t + \bar{t}, v = \text{Re}(\omega),$ and $u = \text{Re}(\omega^{1/2})$:

$X_{-i,j,k,-l}$	Tristram-Levine (TL)	Kashaev (Kas)
	$A += \begin{pmatrix} -r & -t & 2t & \bar{t} \\ -\bar{t} & 0 & \bar{t} & 0 \\ 2\bar{t} & t & -r & -\bar{t} \\ t & 0 & -t & 0 \end{pmatrix}$	$A += \begin{pmatrix} v & u & 1 & u \\ u & 1 & u & 1 \\ 1 & u & v & u \\ u & 1 & u & 1 \end{pmatrix}$
$\bar{X}_{-i,j,k,-l}$	$A += \begin{pmatrix} r & -t & -2\bar{t} & \bar{t} \\ -\bar{t} & 0 & \bar{t} & 0 \\ -2t & t & r & -\bar{t} \\ t & 0 & -t & 0 \end{pmatrix}$	$A -= \begin{pmatrix} v & u & 1 & u \\ u & 1 & u & 1 \\ 1 & u & v & u \\ u & 1 & u & 1 \end{pmatrix}$

... and the quadratic $F := \phi_*Q$ is well-defined only on $D := \ker C$. Exactly what we want, if the Zombian is the signature!

- V : The full space of faces.
 - W : The boundary, made of gaps.
 - Q : The known parts.
 - U : The part yet unknown.
 - $\sigma_V(Q + \phi^*(U))$: The overall Zombian.
 - $\sigma(Q|_{\ker \phi})$: An internal bit. $U + \phi_*Q$: A boundary bit.
- And so our ZPUC is the pair $S = (\sigma(Q|_{\ker \phi}), \phi_*Q)$.

A **Shifted Partial Quadratic (SPQ)** on V is a pair $S = (s \in \mathbb{Z}, Q \text{ a PQ on } V)$. addition also adds the shifts, pullbacks keep the shifts, yet $\phi_*S := (s + \sigma_{\ker \phi}(Q|_{\ker \phi}), \phi_*Q)$ and $\sigma(S) := s + \sigma(Q)$.

Theorem 1’ (Reciprocity). Given $\phi: V \rightarrow W$, for SPQs S on V and U on W we have $\sigma_V(S + \phi^*U) = \sigma_W(U + \phi_*S)$ (and this characterizes ϕ_*S).

Theorem 2. ψ^* and ϕ_* are functorial. Also, if $\alpha // \beta = \gamma // \delta$, α is surjective, β is injective, and $\text{im } \gamma \supset \ker \delta$, then $\gamma^* // \alpha_* = \delta_* // \beta^*$. Finally, ψ^* is additive but ϕ_* isn’t.

Definition. $S \left(\begin{matrix} g_2 \\ f_4 \\ g_3 \\ \dots \end{matrix} \right) := \left\{ \text{SPQ } S \text{ on } \langle g_i \rangle \right\}$.

Theorem 3. $\{S(\text{cyclic sets})\}$ is a planar algebra, with compositions $S(D)((S_i)) := \phi_*^D(\psi_D^*(\bigoplus_i S_i))$, where $\psi_D: \langle f_i \rangle \rightarrow \langle g_{\alpha i} \rangle$ maps every face of D to the sum of the input gaps adjacent to it and $\phi^D: \langle f_i \rangle \rightarrow \langle g_i \rangle$ maps every face to the sum of the output gaps adjacent to it. So for our D , ψ_D is $f_1 \mapsto g_{34}, f_2 \mapsto g_{31} + g_{14} + g_{24} + g_{33}, f_3 \mapsto g_{32}, f_4 \mapsto g_{11}, f_5 \mapsto g_{13} + g_{21}, f_6 \mapsto g_{23}, f_7 \mapsto g_{12} + g_{22}$ and ϕ^D is $f_1 \mapsto g_1, f_2 \mapsto g_2 + g_6, f_3 \mapsto 0, f_4 \mapsto g_3, f_5 \mapsto 0, f_6 \mapsto g_5, f_7 \mapsto g_4$.

Theorem 4. TL and Kas, defined on X and \bar{X} as before, extend to planar algebra morphisms $\{\text{tangles}\} \rightarrow \{S\}$.

Implementation (sources: <http://drorbn.net/icerm23/ap>). I like it most when the implementation matches the math perfectly. We failed here.

$$\begin{pmatrix} A & B \\ C & U \end{pmatrix} \xrightarrow{\det(A)} \begin{pmatrix} I & A^{-1}B \\ C & U \end{pmatrix} \xrightarrow{1} \begin{pmatrix} I & A^{-1}B \\ 0 & U - CA^{-1}B \end{pmatrix}$$

so $\det \begin{pmatrix} A & B \\ C & U \end{pmatrix} = \det(A) \det(U - CA^{-1}B)$. (what if $\#A^{-1}$?)

Questions. 1. Does this have a topological meaning? 2. Is there a version of the Kashaev Conjecture for tangles? 3. Find all solutions of R123 in our "algebra". 4. Braids and the Burau representation. 5. Recover the work in "Prior Art". 6. Are there any concordance properties? 7. What is the "SPQ group"? 8. The jumping points of signatures are the roots of the Alexander polynomial. Does this generalize to tangles? 9. Which of the three Cordon cases is the most common? 10. Are there interesting examples of tangles for which rels is non-trivial? 11. Is the pq part determined by Γ -calculus? 12. Is the pq part determined by finite type invariants? 13. Does it work with closed components / links? 14. Strand-doubling formulas? 15. A multivariable version? 16. Mutation invariance? 17. Ribbon knots? 18. Are there "face-virtual knots"? 19. Does the pushforward story extend to ranks? To formal Gaussian measures? To super Gaussian measures?

Proof of Theorem 1'. Fix W and consider triples $(V, Q, \phi: V \rightarrow W)$ where $Q = (s, D, Q)$ is an SPQ on V . Declare $(V_1, Q_1, \phi_1) \sim (V_2, Q_2, \phi_2)$ if for every quadratic U on W ,

$$\sigma_{V_1}(Q_1 + \phi_1^* U) = \sigma_{V_2}(Q_2 + \phi_2^* U).$$

Given our (V, Q, ϕ) , we need to show:

1. There is an SPQ Q' on W such that $(V, Q, \phi) \sim (W, Q', I)$.
2. If $(W, Q', I) \sim (W, Q'', I)$ then $Q' = Q''$.

Property 2 is easy. Property 1 follows from the following four claims, each of which is easy.

Claim 1. $(V, Q, \phi) \sim (D(Q), Q, \phi|_{D(Q)})$, so wlog, Q is "full", meaning $D(Q) = V$.

Claim 2. If Q is full, $v \in \ker \phi$, and $\lambda := Q(v) \neq 0$, then $(V, Q, \phi) \sim \left(V/\langle v \rangle, \text{sign}(\lambda) + \left(Q - \frac{Q(-, v) \otimes Q(v, -)}{|\lambda|^2} \right), \phi|_{V/\langle v \rangle} \right)$.

So wlog $Q|_{\ker \phi} = 0$ (meaning, $Q|_{\ker \phi \otimes \ker \phi} = 0$).

Claim 3. If $Q|_{\ker \phi} = 0$ and $v \in \ker \phi$, let $V' = \ker Q(v, -)$ and then $(V, Q, \phi) \sim (V', Q|_{V'}, \phi|_{V'})$ so wlog $\phi|_{V \otimes \ker \phi + \ker \phi \otimes V} = 0$.

Claim 4. If $\phi|_{V \otimes \ker \phi + \ker \phi \otimes V} = 0$ then $Q = \phi^* Q'$ for some SPQ Q' on $\text{im } \phi$ and then $(V, Q, \phi) \sim (W, Q', I)$.

Proof of Theorem 2.

It's clear that pullback is functorial and that pushforward by the identity is the identity. To show $(\phi\psi)_* = \phi_*\psi_*$, use theorem 1 repeatedly to get

$$\begin{aligned} & \sigma((\phi\psi)_* Q + U) \\ &= \sigma(Q + (\phi\psi)^* U) \\ &= \sigma(Q + \psi^* \phi^* U) - \sigma(Q|_{\ker \phi\psi}) \\ &= \sigma(\psi_* Q + \phi^* U) + \sigma(Q|_{\ker \psi}) - \sigma(Q|_{\ker \phi\psi}) \\ &= \sigma(\phi_* \psi_* Q + U) + \sigma(Q|_{\ker \psi}) + \sigma(\psi_* Q|_{\ker \phi}) - \sigma(Q|_{\ker \phi\psi}) \\ &= \sigma(\phi_* \psi_* Q + U) \end{aligned}$$

for any U , where the last step uses theorem 1 on $Q|_{\ker \phi\psi}$ with the map $\psi: \ker \phi\psi \rightarrow \ker \phi$.

To show $\alpha_* \gamma^* = \beta^* \delta_*$, first note that $\beta^* \beta_*$ is the identity on any PQ since β is injective, so

$$\alpha_* \gamma^* Q = \beta^* (\beta\alpha)_* \gamma^* Q = \beta^* (\delta\gamma)_* \gamma^* Q = \beta^* \delta_* \gamma_* \gamma^* Q$$

As $\beta^* \delta_* \gamma_* \gamma^* Q$ and $\beta^* \delta_* Q$ have the same values where they are both defined, it remains to show that they have the same domain. Since α is surjective and γ is surjective onto $\ker(\delta)$, we see that

$$\beta^{-1} \delta(A) = \beta^{-1} \delta(A \cap \text{im } \gamma)$$

for any subspace A . By taking $A = \text{ann}_Q(\ker \delta)$, the two sides of the equality become the domains of $\beta^* \delta_* Q$ and $\beta^* \delta_* \gamma_* \gamma^* Q$.

$Q \rightarrow S$ here! ✓

Proof of Thm 2. The functoriality of pullbacks is obvious from the functoriality of pushforwards is obvious from

$$\begin{aligned} \sigma((\phi\psi)_* S + U) &= \sigma(S + (\phi\psi)^* U) = \sigma(S + \psi^* \phi^* U) \\ &= \sigma(\psi_* S + \phi^* U) = \sigma(\phi_* \psi_* S + U) \end{aligned}$$

$$\sigma(S + \delta^* U) = \sigma(\delta_* S + U)$$

$$\sigma(\gamma^* S + \gamma^* \delta^* U) = \sigma(\beta^* \delta_* S + \beta^* U)$$

$$\sigma(\gamma^* S + \delta^* \beta^* U)$$

$$\sigma(\alpha_* \delta^* S + \beta^* U)$$

used: β, γ are surjective.

Jessica's counterexample.

$\phi: V \rightarrow W$ claim: $\phi^* / \phi_* =$ restriction to $\text{im } \phi$.

$\phi_* \leftarrow S$ $\phi^* S$ $\phi_* \phi^* S$ $\phi^* \phi_* S$

$$\begin{aligned} U \text{ on } \text{im } \phi & \sigma(S|_{\text{im } \phi} + U) = \sigma_{\text{im } \phi}(S + U) = \sigma(\phi^* S + \phi^* U) \\ &= \sigma(\phi_* \phi^* S + U) \text{ so } \phi_* \phi^* S = S|_{\text{im } \phi} \square \end{aligned}$$

Theorem 2. ψ^* and ϕ_* are functorial. Also, if $\alpha // \beta = \gamma // \delta$, α is surjective, β is injective, and $\text{im } \gamma \supset \text{ker } \delta$, then $\gamma^* // \alpha_* = \delta_* // \beta^*$. Finally, ψ^* is additive but ϕ_* isn't.

optimistic proof. We know

$$\forall S, U, \sigma(S + \delta^*U) = \sigma(\delta_*S + U)$$

using pullbacks of signatures,

$$\forall S, U, \sigma(\gamma^*(S + \delta^*U)) = \sigma(\beta^*(\delta_*S + U))$$

$$\text{So } \sigma(\gamma^*S + \alpha^*\beta^*U) = \sigma(\beta^*\delta_*S + \beta^*U)$$

$$\sigma(\alpha_*\delta_*S + \beta^*U)$$

Now if $\{\beta^*U\}$ is large enough, then necessarily $\alpha_*\delta_*S = \beta^*\delta_*S$

Needed. $\{\beta^*U\}$ large enough: $\text{ker } \beta \cap \text{im } \alpha = 0$

σ of pullback by β : seems to fail!

σ of pullback by δ :

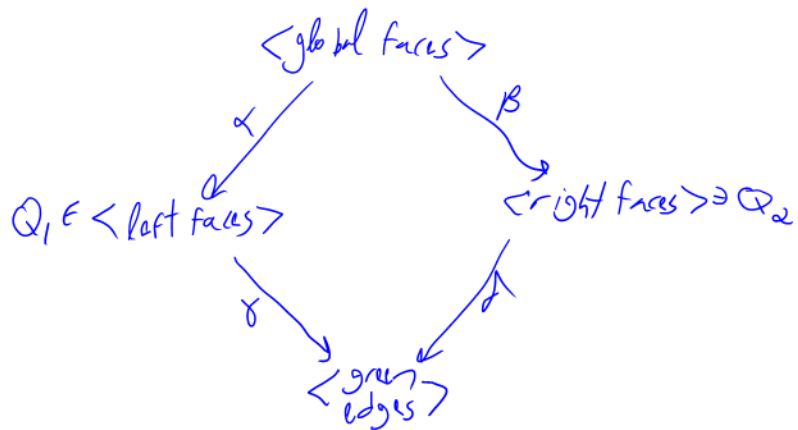

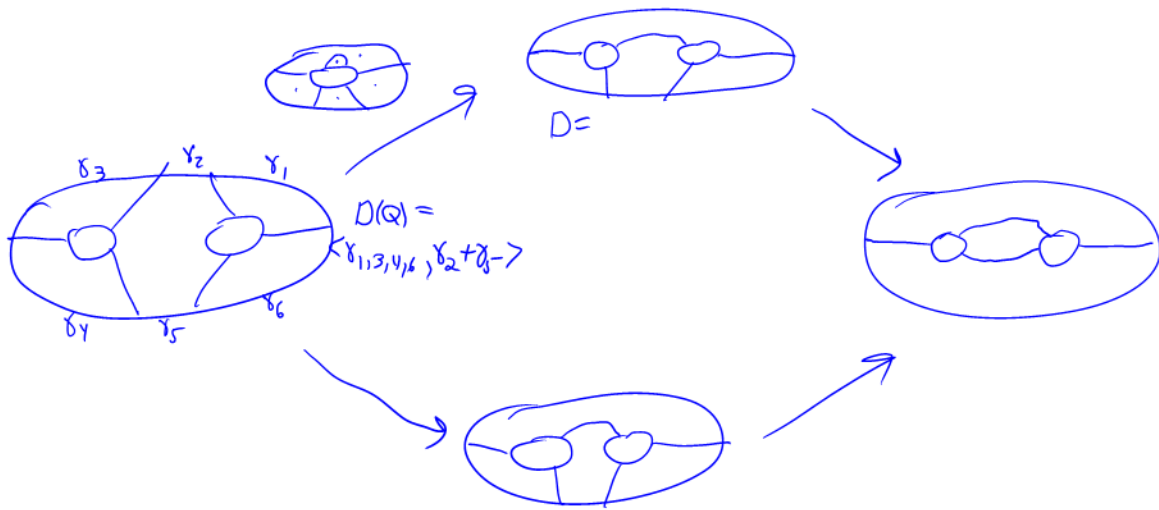

optimistic proof

$$\mu^* // \delta_* // \beta^* // U_* = \mu^* // \gamma^* // \alpha_* // U_* = \psi^* // \phi_*$$

maybe $(\text{im } \alpha + \text{radial}) = \langle \text{all} \rangle$
 $\wedge (\text{im } \delta + \text{radial}) = \langle \text{all} \rangle$
 is enough?

Question: Is it always that

$$\sigma(\alpha^*Q_1 + \beta^*Q_2) = \sigma(\gamma^*Q_1 + \delta^*Q_2) \quad ?$$

Start from

\mathbb{N}	\mathbb{Z}	\mathbb{O}
\mathbb{W}	\mathbb{U}	\mathbb{V}
\mathbb{O}	\mathbb{Z}	\mathbb{Z}

\mathbb{W}	\mathbb{O}	\mathbb{W}
\mathbb{O}	\mathbb{W}	\mathbb{W}
\mathbb{W}	\mathbb{W}	\mathbb{U}

Thm IF $\sigma(\alpha^*Q_1 + \beta^*Q_2) = \sigma(\gamma^*Q_1 + \delta^*Q_2)$

$$\sigma(\pi_*(\alpha^*Q_1 + \beta^*Q_2)) = \sigma(\pi_*(\gamma^*Q_1 + \delta^*Q_2))$$

$$\sigma(Q_1/\alpha^*/\beta^* + Q_2/\beta^*/\delta^*)$$

|| by the pull-push lemma & the surjectivity of α & β

$$\sigma(Q_1/\gamma^* + Q_2/\delta^*)$$

Q: Is it enough that $\text{im } \pi \supset D(\alpha^*Q_1) \cap D(\beta^*Q_2)$
 This sums to be the key! ? *no*

Under the same conditions of the previous Thm,

$$\beta_* \alpha^* Q = \delta_* \gamma_* Q$$

Proof $\forall U, \sigma(\beta_* \alpha^* Q + U) = \sigma(\alpha^* Q + \beta^* U)$

$$= \sigma(\delta_* Q + \delta_* U) = \sigma(\delta_* \gamma_* Q + U) \quad \square$$

Cont.

Is it enough that $\left. \begin{array}{l} \text{im } \pi \supset \text{im } \gamma \cap \text{im } \delta \\ \circ \end{array} \right\}$
